# Enterprise Command Center For Visibility and Control

DevOps Enablement With Vistara

DevOps is about gaining speed and agility with continuous release cycles across dynamic infrastructure resources. As these methods become mainstream, enterprises need to incorporate new ways of developing and delivering applications.

When adopting DevOps methodologies, enterprises require visibility into application performance. DevOps teams need to correlate application performance changes with key events in a continuously changing environment. Vistara Lifecycle Management enables IT teams to easily analyze key changes in the environment and track application performance before and after each update.

Vistara enables enterprises in achieving agile and continuous deployments, which is what DevOps is all about.

Discovery
One time or continuous automatic discovery

Hands Free
Policy based management that automates ops tasks like monitor deployment, resource grouping, service maps and runbooks

Alerts
Alerts generated based on monitoring thresholds; automatically create tickets through alert to tickets policies

Service Desk
Generate and manage incidents from alerts

Knowledge Base
Document best practices and operational guidelines

Cloud Management
On premise and public cloud resources including AWS, Azure and Google

Remote Consoles and Recording
Access any resource remotely with session recording for audit compliance

Integrations
Seamlessly operate with ecosystem of DevOps tools

Vistara Lifecycle Management

Vistara Lifecycle Management enables the DevOps command center that enterprises need to manage the IT operations lifecycle from "cradle to grave" in agile environments.

Vistara enables resource management, application management, and service level management in the same platform. When new resources are created, Vistara's policy-based discovery mechanism identifies resources dynamically and automatically deploys management based on rules at the resource or service level.

With an application centric framework, Vistara dashboards visualize the metrics that are critical to manage your services.

While many point tools can meet one piece of your IT operations management needs, Vistara is the only true IT operations lifecycle management solution that is easy to deploy and delivered in the cloud.

One time or scheduled automatic discovery of cloud resources with credentials

Management policies to apply monitoring templates to service group and device group

CMBD is dead in this dynamic world. Automatically track your assets even as they are created and destroyed

Alerts generated based on monitoring thresholds Automatically create tickets through alert to ticket policies

Dashboards to give you command center for operations

Multiple remote console control Policy based incident processing

Control maintenance windows through APIs without logging into Vistara portal - deploy a build, take specific device into maintenance

Command multiple remote consoles

IT Operations Lifecycle Management

OPTIMIZE · MANAGE · AUTOMATE

Discovery · Monitoring · Alert Management · Service Management · Troubleshooting · Proactive Management · Reporting · Asset Management
